

# Replacing a RazorSafe Hard Drive

Replacement Part # XRS-750, S-RSHD-01, S-RSHD-02, S-RSHD-03, S-RSHD-04, S-RSHD-05  
October 2010  
Part Number: 010-00490g

This document supports RazorSafe RS150, RS200, RS370, RS400, RS6000 and RS6000-B2  
until replaced by a newer version.

# Replacing a RazorSafe Hard Drive

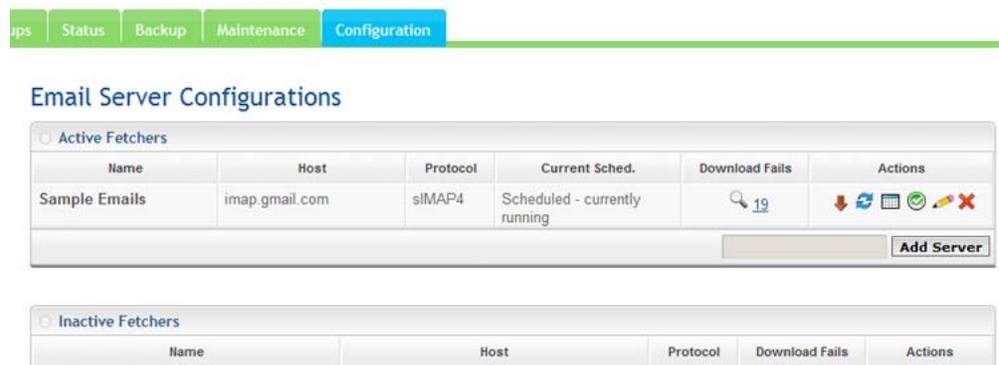

Replacing or adding a RazorSafe hard drive involves the following tasks:

- ◆ [Turning off Email Fetchers](#)
- ◆ [Checking RAID Status](#)
- ◆ [Backing Up the RazorSafe](#)
- ◆ [Powering Off](#)
- ◆ [Locating the Failed Hard Drive](#)
- ◆ [Removing a Failed Hard Drive](#) on page 7
- ◆ [Adding a New Hard Drive](#) on page 8
- ◆ [Powering On](#) on page 12
- ◆ [Check RAID Rebuild Status](#) on page 12
- ◆ [Turn on Email Fetchers](#) on page 12
- ◆ [Returning the Failed Hard Drive](#) on page 13

## Turning off Email Fetchers

Before removing a failed hard drive, turn off the email fetchers. Use the RazorSafe administration interface **Configuration** tab.

Figure 1 Sample RazorSafe Administration Interface for Email Server Configuration

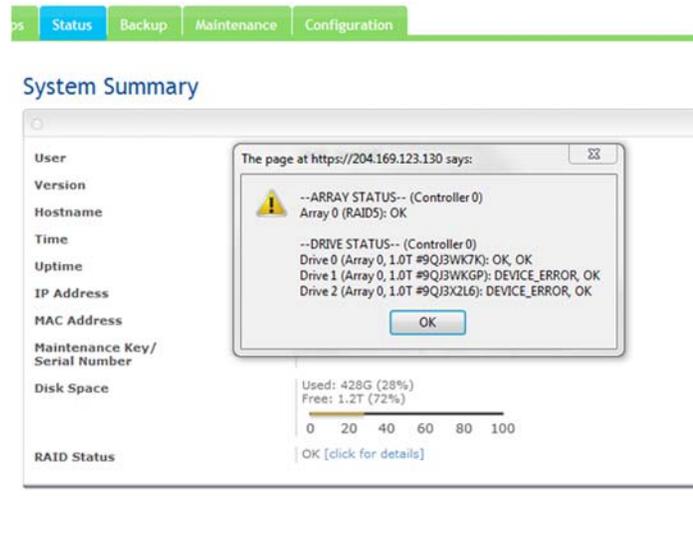

To turn off email fetchers:

1. From the RazorSafe administration interface, click the **Configuration** tab (Figure 1).
2. On the left-side navigation menu under **Email Servers**, click the **POP or IMAP Fetchers** link.
3. In the **Active Fetchers** table, in the **Actions** column, for each server needing to be inactive, click the **red arrow** (Figure 1 on page 3).

## Checking RAID Status

Once the email fetchers are turned off, check the RAID status from the RazorSafe Administration Interface. The **RAID Status** window provides the individual hard drive information including serial number.

Figure 2 Sample RazorSafe Administration Interface for System RAID Status

To check the RAID status:

1. From the RazorSafe administration interface, click the **Status** tab (Figure 3).
2. At the bottom of the **System Summary** screen, at the RAID Status line, click the **click for details** link (Figure 3).

A message window containing the hard drive information displays.

3. Write down the drive number and serial number of the failed drive(s).

The drive number represents the bay location in the appliance chassis.

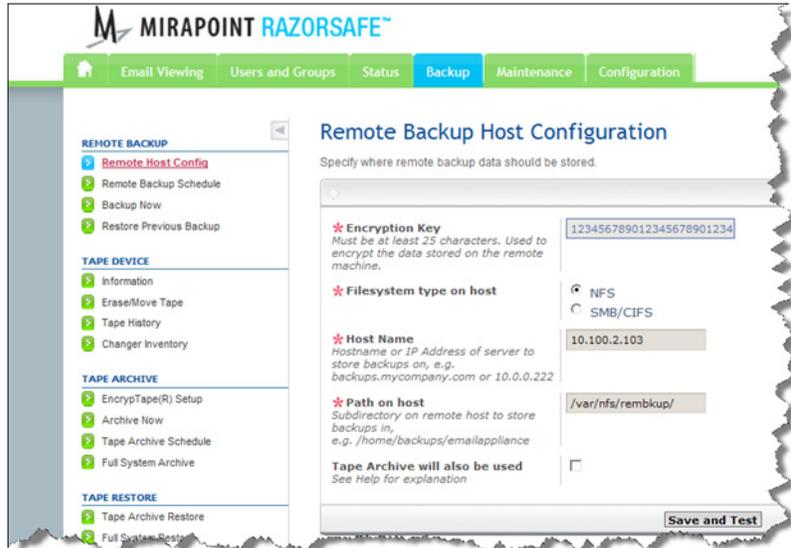

Writing down the failed drive(s) serial number(s) helps you later to verify that the hard drive you pull out of the appliance is the correct hard drive.

---

# Backing Up the RazorSafe

Once the RAID status has been checked and the failed hard drive identified, perform a backup of your RazorSafe data.

Figure 3 Sample RazorSafe Administration Interface for Backup

To backup the RazorSafe data:

1. From the RazorSafe administration interface, click the **Backup** tab (Figure 3).
2. On the left-side navigation menu, click the **Backup Now** link.
3. Click the **Remote Backup Host Configuration** link, and for potential use later, save (write or copy and paste into a text file) all of the displayed configuration information, especially the Encryption Key (Figure 3).

## Locating the Failed Hard Drive

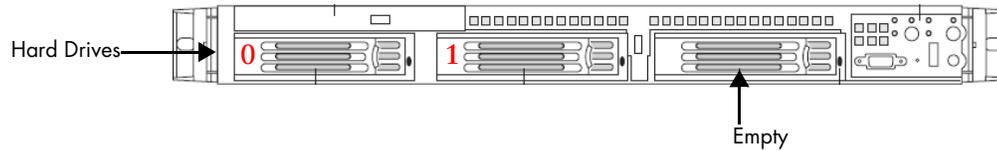

The hard drive bay number locations vary by chassis model.

In addition to identifying the failed disk drive through the RazorSafe administration interface, Mirapoint recommends physically looking at the RazorSafe appliance to identify which disk drive has failed. The failed disk drive will be the one with the amber colored LED illuminated on the disk drive sled, while the functioning disk drives will have green colored LEDs illuminated on the disk drive sleds.

The Drive # identified as failed in the RazorSafe administration interface (Checking RAID Status on page 4) should correspond with the amber colored LED and the following drive ID illustrations.

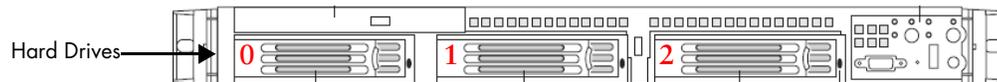

## RS150

The RS150 server has 2 hard drives.

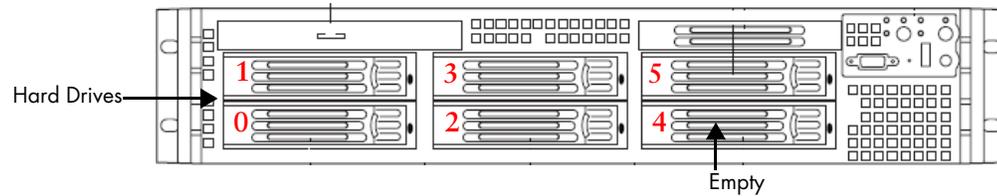

## RS200

The RS200 server has 3 hard drives.

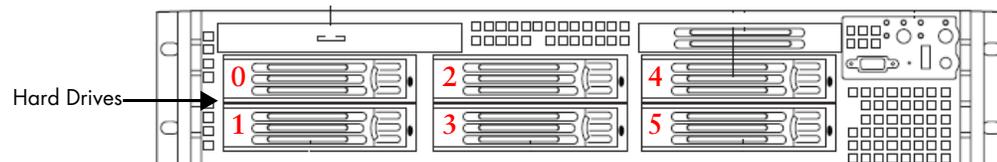

## RS400

The RS400 server has 5 hard drives and one empty drive bay.

## RS370

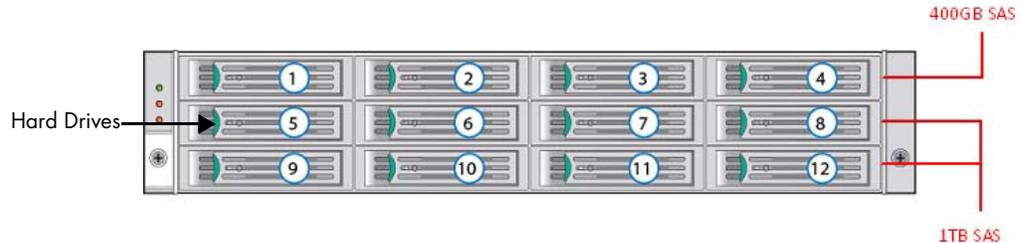

The RS370 server has 6 hard drives. The corresponding **Drive #** location can vary from the illustrated order. You should always verify that the disk drive serial number on the disk matches the serial number displayed in the **Drive Status** diagnostic window. For assistance, contact a Mirapoint Support representative.

---

## RS6000

The RS6000 server has 12 hard drives configured with both 400GB and 1TB drives. The four drives on the top row (slots 1–4) are 400GB drives, and the remaining drives in the second and third rows (slots 5–12) are 1TB drives.

## RS6000-B2

The RS6000-B2 server, unlike the RS6000, is configured with both 450GB and 1TB drives. The four drives on the top row (slots 1–4) are 450GB drives, and the remaining drives in the second and third rows (slots 5–12) are 1TB drives.

Do not combine 400GB and 450GB drives in the same chassis. Mixing is not supported and will cause failures.

## Powering Off

Once you have clearly determined which hard drive needs replacing, and you can reference the serial number, power off the RazorSafe appliance.

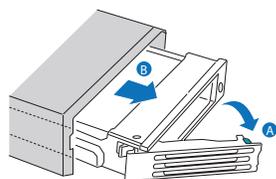

To power off the appliance:

1. From the RazorSafe administration interface, click the **Maintenance** tab.
2. On the left-side navigation menu under **Power Control**, click the **Reboot/Shutdown** link.
3. Click **Shutdown**.

Once the RazorSafe appliance has powered off, disconnect all of the external power cords.

## Removing a Failed Hard Drive

Figure 4 Sample Hard Drive Removal

RS150/RS200/RS370/RS400 Hard Drive

RS6000/RS6000-B2 Hard Drive

To remove a failed hard drive:

1. **RS150/RS200/RS370/RS400**—Press the green tab on the right side of the hard drive chassis door until the locking arm releases, then swing the locking arm to the fully unlocked position (approximately 45 degree angle to the left).

RS6000 hard drive trays have unique dual purpose latching mechanisms and safety locking arm mechanisms to aid in the prevention of accidental hard drive removals.

**RS6000/RS6000-B2**—Unlock the locking mechanism on the locking arm using the Torx\* tool provided with your server, or using a “star” bit tool.

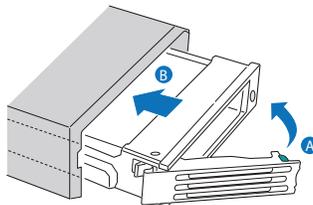

Once unlocked, turn the locking mechanism until the tab can be depressed and swing the locking arm to the fully open position (approximately 45 degree angle to the right).

2. Gently pull the hard drive tray out of the server chassis.
3. Verify that the serial number on the removed hard drive is the same number you wrote down during your drive status diagnostic ([Checking RAID Status](#) on page 4).

Do not degauss the failed hard drive until after your RazorGate appliance is verifiably, fully functional again.

## Adding a New Hard Drive

RS150/RS200/RS370/RS400 Hard Drive

RS6000/RS6000-B2 Hard Drive

Drive trays are designed to be easily installed with little to no force required.

If there is resistance during installation, do not force a hard drive into the chassis.

**RS6000/RS6000-B2**—Do not combine 400GB and 450GB drives in the same chassis. Mixing is not supported and causes failures.

To add a new hard drive:

1. Hold the hard drive label side up with the locking arm facing towards you.
2. With the drive tray in an open unlocked position, using as little force as possible, slide the hard drive tray into the corresponding drive number position in the server chassis.

- 
3. Continue to slide the drive tray into the server chassis until the locking arm makes contact with the chassis frame and forces the locking arm to swing closed.

At this point drive tray should be about ¼” inch from full installation.

4. Gently press the locking arm closed until the hard drive tray fully installs and the locking arm clicks into place.

**RS6000/RS6000-B2**—Lock the locking mechanism on the locking arm using the Torx\* tool provided with your server, or using a “star” bit tool.

## RS150 RAID1 Restoration

The RS150 uses a software-based RAID1 configuration. After replacing your hard drive, complete the process by restoring the RAID1 software configuration.

To restore the RS150 RAID1 configuration:

1. From the console or a putty session, log in and open a shell window.

To login and open a shell window:

- a. Enter the login and password (case sensitive) assigned during the first-time-setup. For example:

Login: miadmin

Password: ChangeMe (factory default password)

- b. Type advanced on the menu.
  - c. Stop the supervisor process by typing the s- command.
  - d. Type “.” <enter> to get to the shell.
2. See which partitions are missing.

If a RAID1 array is degraded by something like a temporary drive failure, it can be restored by simply adding the partition back into the array.

To see which partitions are missing, run the command:

```
% cat /proc/mdstat
```

Normally, part of the output will look like this:

```
|md1 : active raid1 sdb1[1] sda1[0]
|      9767424 blocks [2/2] [UU]
|md2 : active raid1 sdb2[1] sda2[0]
|      3903680 blocks [2/2] [UU]
```

”mdX” is the RAID array composed of partitions on two physical drives, sdaX and sdbX.

- a. If sdaX or sdbX are missing from the array add them back in with this command:

```
% mdadm --add /dev/mdX /dev/sdYX
```

(substitute X with 1,2, or 3. Substitute Y with a or b)

- b. Check the progress of the re-sync with this command:

```
% cat /proc/mdstat
|md1 : active raid1 sdb1[2] sda1[0]
|      9767424 blocks [2/1] [U_]
|      [>.....] recovery = 1.0% (100800/
9767424) finish=3.1min speed=50400K/sec
```

- c. Repeat for any other missing partitions.
3. Test the drive speed, which is sometimes unexpectedly low in a drive that is going bad.

```
% hdparm -tT /dev/sdY
```

- a. If the drive is mechanically bad and cannot be added back into the array, it will need replacing.
- b. Request a replacement drive and replace the bad drive.

Drive bay 0 is usually drive “sdaX” and drive bay 1 is usually “sdbX”.

4. View the original partition setup.

To see the partition setup of the good/original drive, use the command `fdisk -l`.

The original partition setup on the failed hard drive needs to be replicated on to the new replacement hard drive.

```
% fdisk -l
```

```
|Disk /dev/sda: 500.1 GB, 500107862016 bytes
|255 heads, 63 sectors/track, 60801 cylinders
|Units = cylinders of 16065 * 512 = 8225280 bytes
|
|  Device Boot      Start         End      Blocks   Id  System
|/dev/sda1            1          1216     9767488+  fd  Linux
raid autodetect
|/dev/sda2           1217         1702     3903795   fd  Linux
raid autodetect
|/dev/sda3           1703        60801    474712717+ fd  Linux
raid autodetect
```

5. Replicate the partition information.

To replicate the partition info from the good/original hard drive on to the new replacement hard drive:

```
% fdisk /dev/sdX
```

```
Command (m for help): n
|Command action
|  e   extended
|  p   primary partition (1-4)
```

```

p
Partition number (1-4): 1
First cylinder (1-60801, default 1):
|Using default value 1
Last cylinder or +size or +sizeM or +sizeK (1-1216, default
1216): 1216
|
Command (m for help): t
Partition number (1-4): 1
Hex code (type L to list codes): fd
|Changed system type of partition 1 to fd (Linux raid
autodetect)

```

6. Repeat the information replication for the other partitions.
7. Print the partition table.

To print the partition table and ensure that it exactly matches the other (good) drive, use the `p` command.

```

Command (m for help): p
|
|Disk /dev/sdb: 500.1 GB, 500107862016 bytes
|255 heads, 63 sectors/track, 60801 cylinders
|Units = cylinders of 16065 * 512 = 8225280 bytes
|
| Device Boot      Start         End      Blocks   Id  System
|/dev/sdb1          1           1216    9767488+  fd  Linux
raid autodetect
|/dev/sdb2         1217         1702     3903795   fd  Linux
raid autodetect
|/dev/sdb3         1703        60801   474712717+ fd  Linux
raid autodetect

```

8. Save the partition table.

To save the partition table and preserve your changes, use the `w` command.

```

Command (m for help): w
|The partition table has been altered!
|
|Calling ioctl() to re-read partition table.
|
|WARNING: Re-reading the partition table failed with error 16:
Device or resource busy.
|The kernel still uses the old table.
|The new table will be used at the next reboot.

```

| Syncing disks.

9. Re-add the missing partitions identified in Step 2.

To re-add the missing partitions to each array:

```
% mdadm --add /dev/md1 /dev/sdY1
```

```
% mdadm --add /dev/md2 /dev/sdY2
```

```
% mdadm --add /dev/md3 /dev/sdY3
```

(Substitute *Y* with *a* or *b*)

10. Exit shell by typing `exit`.
11. Restart supervisor by typing `s+`.

## Powering On

Once you complete the hard drive replacement, power on your RazorSafe appliance.

To power on your RazorSafe appliance:

1. Re-connect all external power cords ([Powering Off](#) on page 7).
2. If you are using an external backup tape device, power it on.
3. Power on your RazorSafe appliance.

## Check RAID Rebuild Status

Once the RazorSafe appliance is powered on the RAID array should automatically begin rebuilding. Verify the rebuild status.

To check RAID rebuild status:

1. From the RazorSafe administration interface, click the **Status** tab ([Figure 3](#) on page 5).
2. At the bottom of the **System Summary** screen, at the RAID Status line, click the **click for details** link ([Figure 3](#) on page 5).

A message window containing the hard drive information displays. The **ARRAY STATUS** should read: **rebuilding**.

## Turn on Email Fetchers

Once the disk array rebuild is complete, turn on the email fetchers.

To turn on email fetchers:

1. From the RazorSafe administration interface, click the **Configuration** tab.
2. On the left-side navigation menu under **Email Servers**, click the **POP or IMAP Fetchers** link.
3. In the **Inactive Fetchers** table, in the **Actions** column, for each server needing to be active, click the **green arrow**.

---

## Returning the Failed Hard Drive

For failed hard drive return procedures, refer to the return materials authorization (RMA) documentation provided with the replacement hard drive or contact your Mirapoint Certified Service Provider.
